

Case Study UK Regulator

The Client

A key UK Regulator.

The need

Safeguard International was asked to recover a number of sources that were housed in gauges located at a derelict chemical factory in the North East of England. There was considerable urgency as the sources were in danger of being stolen from the site.

The Solution

Safeguard International provides the orphan source disposal service under the UK's NAIR programme.

We despatched a small team to the site at short notice to examine the gauges and devise a bespoke approach for opening the gauges on site and removing the sources into shielded containers.

The level of concern about these units meant that the Safeguard International team was accompanied throughout by two officers from the Regulator as well as Counter Terrorism Security Advisers.

The benefits

The considerable expertise in the Safeguard International site team resulted in a solution being found to remove the sources from the gauges and thus avoid having to dispose of the entire volume. The resulting cost-savings for the client were significant.

Safeguard International's thorough approach to the problem and attention to general safety and good dose management practice provided the peace of mind for the client that the job would be done properly and this significant and awkward liability would be dealt with.
